Thailand Ocean Logistics Intelligence — printed 2026-07-31T23:58:46.205Z

Coverage: insufficient · Data cutoff: 2026-07-31T14:20:00Z · <http://localhost:8000/index.html#/overview>

Overview

What the platform can currently say about Thailand ocean logistics, and how much of it is actually supported by evidence.

Live coverage: insufficient.

Live coverage is INSUFFICIENT. No source in the registry is enabled and none has completed a controlled live validation, so the platform holds no live-retrieved or human-reviewed evidence at all. Every current reading below is therefore 'insufficient evidence' -- which is a coverage gap, not a finding that conditions are normal. Synthetic and historical-validation fixtures are shown only in the separately labelled Technical demonstration panels and never contribute to a current reading.

Zero evidence: no source has collected any qualifying record, so one or more capabilities required for publication have no coverage at all. Data cutoff 2026-07-31T14:20:00Z.

OVERALL DIRECTION

**insufficient
evidence**

Transparent roll-up of the lane directions, not a composite score.

EVIDENCE COVERAGE

insufficient

Zero evidence: no source has collected any qualifying record, so one or more capabilities required for publication have no coverage at all.

QUALIFIED OBSERVATIONS

0

Live-retrieved or human-reviewed records. Fixtures are excluded.

QUALIFIED EVENTS

0

Events with retrieved or human-reviewed evidence.

LANES NEEDING ATTENTION

0

Out of the published lane set.

ACTIVE VERIFIED EVENTS

0

Confirmed still active at the data cutoff.

Lanes requiring attention

Lanes at an attention level above routine. Attention level is derived from domain directions and open events; it is not a risk score.			
Lane	Attention	Direction	Resolution
No lane is above routine attention. With no qualified evidence, no lane can be raised — which is a coverage gap, not an all-clear.			

Key changes

- No current assessment can be produced: the platform holds no live-retrieved or human-reviewed evidence, so there is nothing to compare and nothing to report.

Major data gaps

- Source Health reports overall current-publication coverage 'insufficient': Zero evidence: no source has collected any qualifying record, so one or more capabilities required for publication have no coverage at all.
- cost and freight context: No qualified current-publication record supports this capability.
- global baseline context: No qualified current-publication record supports this capability.
- operational event evidence: No qualified current-publication record supports this capability.
- thailand port or maritime activity: No qualified current-publication record supports this capability.
- thailand trade flow: No qualified current-publication record supports this capability.
- 11 of 11 Ocean lane(s) have no qualified domain at all; every domain in that lane reads insufficient_evidence.
- No qualified operational event exists, so no congestion, waiting-time or berth-delay statement can be made anywhere in the platform.

Current cost pressure

No qualified cost observation exists, so no current cost pressure reading is published. The table below is a technical demonstration built from synthetic fixtures.

▼ Demonstration material technical demonstration — synthetic fixture

The figure and table below are generated from synthetic fixtures. They describe no real-world condition and must not be quoted as one.

11

Technical demonstration only — synthetic fixtures.

Cost pressure — demonstration

technical demonstration

Latest reading per cost-context series, with its own freshness. A stale reading is labelled stale; it is never presented as current.

Series	Latest value	Period	Month over month	Freshness
container_freight_benchmark SYNTHETIC_FIXTURE — stands in for FBX_PUBLIC · synthetic test fixture	2,136.70 index_points	2026- 06-30	+6.53%	fixture not live age unknown
thailand_diesel_retail_price SYNTHETIC_FIXTURE — stands in for EPPO_FUEL · synthetic test fixture	32.34 THB_per_litre	2026- 06-30	+0.78%	fixture not live age unknown
usd_thb_reference_rate SYNTHETIC_FIXTURE — stands in for BOT_FX · synthetic test fixture	34.77 THB_per_USD	2026- 06-30	-0.80%	fixture not live age unknown

Ocean Operations

Thailand port and maritime indicators, the lane set, chokepoint exposure, official notices, and the capacity and service evidence that exists.

Every port series here is a VOLUME measure. Rising throughput means more cargo moved; it is not congestion. No congestion, berth-delay, yard-congestion or truck-delay statement is made anywhere in this Dashboard, because no operational-condition source is monitored.

Thailand port and maritime indicators — current

No qualified port or maritime observation exists, so no current reading is published. This is a coverage gap, not a finding that activity is normal.

Current official operational notices

No current notice record exists. No notice channel is monitored live and no human-reviewed notice has been entered, so this is an absence of records rather than evidence that no notice was published.

Current capacity and service evidence

Capacity and service impacts recorded against a currently active event, each backed by qualified evidence.

Event	Area	Status	Severity	Evidence	Confidence
No qualified capacity or service impact is recorded against a currently active event. This is a coverage gap, not an all-clear.					

Ocean lanes

Each lane states the analytical resolution it actually supports. A regional lane is never displayed as a port-pair lane.

Current lane assessments. Expand a row for the full domain assessment, data gaps, selection evidence and known li

▼ Current domain assessments (9)

Domain-by-domain assessment. Each domain is independently sourced and freshness-stamped; none is inferred from another.

Domain	Direction	Threshold rule	Data period	Freshness
thailand trade flow	insufficient evidence	no threshold rule (event or coverage derived)	none	no data unknown
port maritime activity	insufficient evidence	no threshold rule (event or coverage derived)	none	no data unknown
freight benchmark direction	insufficient evidence	no threshold rule (event or coverage derived)	none	no data unknown
fuel pressure	insufficient evidence	no threshold rule (event or coverage derived)	none	no data unknown
fx pressure	insufficient evidence	no threshold rule (event or coverage derived)	none	no data unknown
operational event status	insufficient evidence	no threshold rule (event or coverage derived)	none	no data unknown
capacity evidence	insufficient evidence	no threshold rule (event or coverage derived)	none	no data unknown
transit time or service evidence	insufficient evidence	no threshold rule (event or coverage derived)	none	no data unknown
source freshness and coverage	insufficient evidence	no threshold rule (event or coverage derived)	none	no data unknown

▼ Current data gaps (1)

- No live-retrieved or human-reviewed evidence exists for this lane. Synthetic and historical-validation fixtures exercise the analysis engine but are excluded from the current view, so there is nothing to assess -- which is a coverage gap, not a finding that conditions are normal.

A technical-demonstration assessment exists for this lane in the demonstration region below. It describes no real-world condition and carries no current value. [See the demonstration assessment.](#)

Lane	Attention	Direction	Resolution	Mode	Chokepoint
▼ Selection evidence (3)					
Why this lane was selected, and on what basis.					
Criterion	Statement	Evidence class		Reference	
strategic trade relevance	Mainland China is Thailand's largest single-country ocean trade counterpart by both import and export container flow, making it the highest-priority lane group for a Thailand-centred Ocean module.	analytical inference		none	
operational distinctiveness	Predominantly served by direct intra-Asia services without transiting Malacca westbound, so its operational risk profile differs materially from westbound lanes.	analytical inference		none	
data availability	TH_CUSTOMS partner-country trade series and IMF PortWatch port-call series would both cover this lane once qualified; neither is enabled.	insufficient evidence		docs/source_qualification_repo	
Data period used: none — no dated quantitative evidence was retrieved					
▼ Known limitations (2)					
- No quantitative Thailand trade ranking was retrieved under WO-010; the trade-value criterion is recorded as analytical inference, not as a measured ranking. - Resolution is country-level: the platform holds no Thailand port-pair statistics, so this lane must not be displayed as a port-pair lane.					
Thailand ↔ Japan and Korea LANE-OCEAN-TH-JPKR	insufficient evidence	insufficient evidence	country	sea	none regi

Thailand seaports → Japan and Republic of Korea · reviewed 2026-07-24 · provisional

operational event status	insufficient evidence	no threshold rule (event or coverage derived)	none	no data unknown	
capacity evidence	insufficient evidence	no threshold rule (event or coverage derived)	none	no data unknown	
transit time or service evidence	insufficient evidence	no threshold rule (event or coverage derived)	none	no data unknown	
source freshness and coverage	insufficient evidence	no threshold rule (event or coverage derived)	none	no data unknown	
▼ Current data gaps (1)					
No live-retrieved or human-reviewed evidence exists for this lane. Synthetic and historical-validation fixtures exercise the analysis engine but are excluded from the current view, so there is nothing to assess -- which is a coverage gap, not a finding that conditions are normal.					

A technical-demonstration assessment exists for this lane in the demonstration region below. It describes no real-world condition and carries no current value. [See the demonstration assessment.](#)

Lane	Attention	Direction	Resolution	Mode	Chokepoint
▼ Selection evidence (2)					
Why this lane was selected, and on what basis.					
Criterion	Statement	Evidence class		Reference	
strategic trade relevance	Japan and Korea anchor Thailand's manufacturing supply chains, particularly automotive and electronics components, giving this lane distinct continuity relevance.	analytical inference		none	
operational distinctiveness	Japan and Korea are commonly served on shared North East Asia service strings, so they behave as one operational group rather than two independent lanes.	analytical inference		none	
Data period used: none — no dated quantitative evidence was retrieved					
▼ Known limitations (2)					
- No quantitative Thailand trade ranking was retrieved under WO-010. - Grouping Japan and Korea reflects service-string structure; it will understate a disruption affecting only one of the two countries.					
Thailand ↔ ASEAN and Singapore transshipment LANE-OCEAN-TH-ASEAN-SG	insufficient evidence	insufficient evidence	regional	sea	CHK-MAL CHK-SING

transit time or service evidence	insufficient evidence	no threshold rule (event or coverage derived)	none	no data unknown
source freshness and coverage	insufficient evidence	no threshold rule (event or coverage derived)	none	no data unknown

▼ Current data gaps (1)

- No live-retrieved or human-reviewed evidence exists for this lane. Synthetic and historical-validation fixtures exercise the analysis engine but are excluded from the current view, so there is nothing to assess -- which is a coverage gap, not a finding that conditions are normal.

A technical-demonstration assessment exists for this lane in the demonstration region below. It describes no real-world condition and carries no current value. [See the demonstration assessment.](#)

Lane	Attention	Direction	Resolution	Mode	Chokepoi
------	-----------	-----------	------------	------	----------

▼ Selection evidence (3)

Why this lane was selected, and on what basis.

Criterion	Statement	Evidence class	Reference
operational distinctiveness	This lane carries both direct intra-ASEAN cargo and the transshipment leg of most Thailand long-haul services, so disruption here propagates into several other lanes.	analytical inference	none
chokepoint exposure	Directly exposed to the Strait of Malacca and the Singapore Strait, the two chokepoints nearest to Thailand.	verified fact	data/reference/dimensions.json#chokep
source backed analysis support	MPA Singapore publishes port marine notices, giving this lane an official operational-notice channel that most other lanes lack.	official publication	config/sources.yaml#MPA_SG_NOTICE

Data period used: none — no dated quantitative evidence was retrieved

▼ Known limitations (3)

- No quantitative Thailand trade ranking was retrieved under WO-010, so the trade-value criterion was not applied to this lane; selection rests on the recorded structural criteria.
- Resolution is regional: transshipment volumes attributable to Thailand cargo are not separable from any public source the platform has qualified.

Lane	Attention	Direction	Resolution	Mode	Chokepoi
A Singapore port notice is evidence of the notice, not automatically of an effect on Thailand cargo.					
Thailand ↔ South Asia LANE-OCEAN-TH-SASIA	insufficient evidence	insufficient evidence	regional	sea	CHK-MAL

transit time or service evidence	insufficient evidence	no threshold rule (event or coverage derived)	none	no data unknown	
source freshness and coverage	insufficient evidence	no threshold rule (event or coverage derived)	none	no data unknown	
▼ Current data gaps (1)					
No live-retrieved or human-reviewed evidence exists for this lane. Synthetic and historical-validation fixtures exercise the analysis engine but are excluded from the current view, so there is nothing to assess -- which is a coverage gap, not a finding that conditions are normal.					

A technical-demonstration assessment exists for this lane in the demonstration region below. It describes no real-world condition and carries no current value. [See the demonstration assessment.](#)

▼ Selection evidence (3)

Why this lane was selected, and on what basis.

Criterion	Statement	Evidence class	Reference
chokepoint exposure	The highest chokepoint-exposure lane in the set: normal routing transits Malacca, Bab el-Mandeb and Suez in sequence, so a single chokepoint event can lengthen the whole lane.	verified fact	data/reference/dimensions.json#chokep
strategic trade relevance	The European Union is a major Thailand export destination bloc, with North European gateways handling the majority of the container flow.	analytical inference	none
source backed analysis support	The Suez Canal Authority publishes circulars, giving this lane a registered official notice channel for its principal chokepoint.	official publication	config/sources.yaml#SCA_CIRCULAR

Data period used: none — no dated quantitative evidence was retrieved

▼ Known limitations (2)

- No quantitative Thailand trade ranking was retrieved under WO-010.
- Most Thailand North Europe cargo is transshipped rather than carried on direct services, so lane performance depends on the ASEAN/Singapore lane as well.

▼ Selection evidence (2)					
Why this lane was selected, and on what basis.					
Criterion	Statement	Evidence class		Refer	
geographic coverage	Included so the lane set covers the southbound direction; without it the Ocean module would have no lane south of the equator.	analytical inference		none	
operational distinctiveness	Served largely on direct services with no chokepoint transit, providing a comparison baseline against chokepoint-exposed lanes.	analytical inference		none	
Data period used: none — no dated quantitative evidence was retrieved					
▼ Known limitations (2)					
- No quantitative Thailand trade ranking was retrieved under WO-010. - Smallest lane in the set by expected volume; indicator movements will be correspondingly noisier.					
Thailand domestic port and inland connection (Laem Chabang ↔ Bangkok hinterland) LANE-OCEAN-TH-DOMESTIC	insufficient evidence	insufficient evidence	corridor	sea	none regi

Laem Chabang and Bangkok Port → Thailand inland hinterland · reviewed 2026-07-24 · provisional

current

▼ Current domain assessments (9)

Domain-by-domain assessment. Each domain is independently sourced and freshness-stamped; none is inferred from another.

Domain	Direction	Threshold rule	Data period	Freshness
thailand trade flow	insufficient evidence	no threshold rule (event or coverage derived)	none	no data unknown
port maritime activity	insufficient evidence	no threshold rule (event or coverage derived)	none	no data unknown
freight benchmark direction	insufficient evidence	no threshold rule (event or coverage derived)	none	no data unknown
fuel pressure	insufficient evidence	no threshold rule (event or coverage derived)	none	no data unknown
fx pressure	insufficient evidence	no threshold rule (event or coverage derived)	none	no data unknown
operational event status	insufficient evidence	no threshold rule (event or coverage derived)	none	no data unknown
capacity evidence	insufficient evidence	no threshold rule (event or coverage derived)	none	no data unknown
transit time or service evidence	insufficient evidence	no threshold rule (event or coverage derived)	none	no data unknown
source freshness and coverage	insufficient evidence	no threshold rule (event or coverage derived)	none	no data unknown

▼ Current data gaps (1)

- No live-retrieved or human-reviewed evidence exists for this lane. Synthetic and historical-validation fixtures exercise the analysis engine but are excluded from the current view, so there is nothing to assess -- which is a coverage gap, not a finding that conditions are normal.

A technical-demonstration assessment exists for this lane in the demonstration region below. It describes no real-world condition and carries no current value. [See the demonstration assessment.](#)

Lane	Attention	Direction	Resolution	Mode	Chokepoi
▼ Selection evidence (2)					
Why this lane was selected, and on what basis.					
Criterion	Statement	Evidence class	Reference		
operational distinctiveness	Every international lane terminates at a Thailand port, so domestic port condition is a shared dependency of all of them and is assessed separately rather than duplicated into each lane.	analytical inference	none		
data availability	Thailand port-authority notices and Thailand port throughput series, once qualified, apply to this lane directly rather than through a partner country.	insufficient evidence	docs/source_qualification_repo		
Data period used: none — no dated quantitative evidence was retrieved					
▼ Known limitations (3)					
- No quantitative Thailand port or trade series was retrieved under WO-010, so data_period_used is null and the selection rests on the recorded structural criteria. - The Ocean module covers only the seaport leg. Inland road and rail drayage is a Land-module concern and is explicitly not assessed by WO-010. - This lane is mode-tagged 'sea' because only its seaport leg is in scope; the inland leg will require a separate road or rail lane record when the Land module is built.					

Chokepoints

Registered chokepoints, the lanes exposed to each, and whether an official notice is recorded.					
Chokepoint	Type	Modes	Operating authority	Exposed lanes	Notice status

▼ Known limitations (3)

- No baseline is defined for this series, so no deviation from baseline is published.
- Generated by scripts/generate_synthetic_fixtures.py. This value is a synthetic test fixture, not a published statistic, and must not be read as an observation of the real world.
- Throughput measures how much cargo moved. It can never on its own establish congestion, waiting time or berth delay.

Trade & Flow

Thailand import and export value by lane group, with period comparisons and revision status.

No qualified Thailand trade observation exists, so no current trade reading is published.

Current trade flows

No qualified trade-value observation exists for any lane, so no current reading is published. This is a coverage gap, not evidence that trade stopped.

Lane selection methodology is documented in docs/ocean_lane_selection.md. No quantitative Thailand trade ranking was retrieved, so lanes were selected on documented structural criteria and every lane records that limitation. Published trade statistics can be revised. Every observation carries a revision number and, where the source provides one, a revision timestamp; the derived readings report whether the current period is original or revised.

▼ **Demonstration material**
technical demonstration — synthetic fixture

▼ Known limitations (3)

- No baseline is defined for this series, so no deviation from baseline is published.
- Generated by scripts/generate_synthetic_fixtures.py. This value is a synthetic test fixture, not a published statistic, and must not be read as an observation of the real world.
- Trade value is an all-mode total. It is not an ocean-only figure and must not be presented as ocean freight volume.

Thailand ↔ Mediterranean

Lane resolution is regional. The platform holds no Thailand port-pair statistics, so this must not be read as a port-pair figure.

▼ Known limitations (3)

- No baseline is defined for this series, so no deviation from baseline is published.
- Generated by scripts/generate_synthetic_fixtures.py. This value is a synthetic test fixture, not a published statistic, and must not be read as an observation of the real world.
- Trade value is an all-mode total. It is not an ocean-only figure and must not be presented as ocean freight volume.

Cost & Freight

Fuel, FX and freight benchmarks. Each series states what kind of number it is.

No qualified cost observation exists, so no current cost or freight pressure reading is published.

Current cost readings

No qualified cost-context reading exists, so no current value is published. This is a coverage gap, not evidence that costs are stable.

Benchmark limitations

- The container freight series is a market benchmark for a third route, published here only as a directional indicator.
- It is not a Thailand shipment quotation, not a Thailand average, and not a rate any shipper was charged.
- No qualified dataset covering Thailand-origin freight rates exists in this registry, so no Thailand freight average is published anywhere in the platform.
- Retail diesel is a domestic cost-context series. It is not a bunker fuel price.
- A crude benchmark is upstream energy context; pass-through to bunker cost and then to freight cost is neither immediate nor proportional.

Surcharges and fees

No surcharge or fee series is published. No source in this registry that publishes carrier surcharges has been qualified, so the platform records that as a coverage gap rather than estimating one.

▼ Demonstration material [technical demonstration — synthetic fixture](#)

Technical demonstration — every series below is a synthetic fixture standing in for a production candidate. No fuel, FX or freight figure has been retrieved.

These are benchmarks, not quotations.

It is not a Thailand shipment quotation, not a Thailand average, and not a rate any shipper was charged.

▼ Known limitations (1)

- No baseline is defined for this series, so no deviation from baseline is published.

Events

Direct operational events, external drivers and discovery leads are kept separate. An external driver stays contextual until a transmission mechanism is stated.

An external driver stays contextual until a Logistics transmission mechanism is stated. A discovery lead may surface an item but can never be the sole evidence for a material impact

conclusion.

Current direct operational events

No current event records exist. Every event the platform holds is a historical validation fixture with an assessment cutoff in the past; none is evidence of a current condition, and none appears above.

No current direct operational event is recorded. Every event held is a historical validation fixture. An empty list here is a coverage gap, not an all-clear.

Current external drivers

No current external driver is recorded. An empty list here is a coverage gap, not a finding that no driver exists.

▼ Historical validation material historical validation — not a current condition

Historical validation — each case is assessed at its own cutoff, shown on the card. These exercise the event model and describe no current condition.

canal restriction

Thailand relevance: low

event severity: moderate

Panama Canal Authority restricts daily transit slots during drought conditions

EVT-20231030-001 · event date 2023-10-30 · published 2023-10-30 · retrieved 2023-11-15T00:00:00Z · last reviewed 2023-11-15T00:00:00Z · no confirmation that this event is still active

- **External driver:** Prolonged drought reduced the water available to operate the canal's lock system.
- **Operational change:** The canal authority reduced the number of daily transit slots and applied draft restrictions.
- **Logistics mechanism:** Fewer slots force waiting, slot auctions, or rerouting via Suez or the United States West Coast, each of which changes transit time or cost.
- **Observable indicator:** Canal authority advisories stating the slot count and draft limit.
- **Outcome:** Potential transit-time and cost effects on Thailand services routed to the United States East and Gulf Coast via Panama.

Chain completeness: complete

Thailand relevance basis:

- The Panama Canal is a routing option for Asia to United States East and Gulf Coast services, which is one Thailand lane.
- Whether any given Thailand service actually routes via Panama rather than Suez is carrier-specific and is not published by any source qualified in this registry, so exposure is potential rather than confirmed.

▼ Lane relevance (1)

Which lanes this event is relevant to, and why.

Lane	Relevance	Basis
LANE-OCEAN-TH-USEC	medium	lane transits chokepoint CHK-PANAM

▼ Nine-area impact assessment

Impact by area. Event severity, impact severity, evidence strength and confidence are recorded separately.

Area	Status	Severity	Relevance	Evidence	Confidence
warehouse	insufficient evidence	none	low	C	low
logistics	insufficient evidence	none	low	C	low
transport	potential	low	low	A	medium
import export	insufficient evidence	none	low	C	low
inventory	insufficient evidence	none	low	C	low
cost	potential	low	low	A	low
capacity	insufficient evidence	none	low	C	low
service	insufficient evidence	none	low	C	low
business continuity	insufficient evidence	none	low	C	low

Event severity, impact severity, evidence strength and confidence are recorded separately and none is inferred from another. This event carries no negative operational evidence, so no area may report no material impact.

▼ Evidence (1)

Every evidence record behind this event, with its retrieval and publication status.

human review pending

Container carriers divert Asia–Europe services away from the Red Sea and Suez routing

EVT-20231218-001 · event date 2023-12-18 · published 2023-12-18 · retrieved 2024-01-15T00:00:00Z · last reviewed 2024-01-15T00:00:00Z · no confirmation that this event is still active

- **External driver:** Security risk to merchant shipping in the southern Red Sea and Gulf of Aden.
- **Operational change:** Carriers rerouted Asia–Europe services around the Cape of Good Hope instead of transiting Bab el-Mandeb and Suez.
- **Logistics mechanism:** A longer routing absorbs more vessel days per round trip, which withdraws effective capacity from the service string and shifts arrival schedules.
- **Observable indicator:** Published carrier service advisories, Suez Canal transit counts, and container freight benchmarks for Asia–Europe routings.
- **Outcome:** Observed increase in transit time on affected Asia–Europe strings, with potential cost and capacity effects on Thailand lanes routed through the same corridor.

Chain completeness: complete

Thailand relevance basis:

- Thailand westbound container services to Northern Europe and the Mediterranean normally transit Bab el-Mandeb and the Suez Canal, so a routing change on that corridor lengthens the Thailand lanes that use it.
- The relationship is a lane-transit relationship, not a Thailand-specific event: nothing here establishes an effect on any particular Thailand service or shipper.

▼ Lane relevance (3)

Which lanes this event is relevant to, and why.

Lane	Relevance	Basis
LANE-OCEAN-TH-MED	medium	lane includes country EG; lane transits chokepoint CHK-BABELMANDEB; lane transits chokepoint CHK-SUEZ
LANE-OCEAN-TH-NEUR	medium	lane transits chokepoint CHK-BABELMANDEB; lane transits chokepoint CHK-SUEZ

Lane	Relevance	Basis
LANE-OCEAN-TH-USEC	medium	lane transits chokepoint CHK-SUEZ

▼ Nine-area impact assessment

Impact by area. Event severity, impact severity, evidence strength and confidence are recorded separately

Area	Status	Severity	Relevance	Evidence	Confidence
warehouse	insufficient evidence	none	low	C	low
logistics	insufficient evidence	none	low	C	low
transport	observed	moderate	high	A	medium
import export	potential	low	medium	B	low
inventory	insufficient evidence	none	low	C	low

Francis Scott Key Bridge collapse suspends vessel traffic at the Port of Baltimore

EVT-20240326-001 · event date 2024-03-26 · published 2024-03-26 · retrieved 2024-04-05T00:00:00Z · last reviewed 2024-04-05T00:00:00Z · no confirmation that this event is still active

× **External driver:** not established

- **Operational change:** Vessel traffic into and out of the Port of Baltimore was suspended after the bridge collapse blocked the channel.
- **Logistics mechanism:** A closed channel removes a port from the service rotation and forces cargo to alternative United States East Coast gateways.
- **Observable indicator:** Port and coastguard notices, and port call counts for Baltimore and neighbouring East Coast ports.
- **Outcome:** Observed suspension of Baltimore vessel traffic. No Thailand lane effect is established, because no evidence links Thailand ocean cargo to this port.

Chain completeness: **complete**

Thailand relevance: none established. The platform has found no basis to assess a Thailand effect; this is not a finding that there is none.

▼ Lane relevance (2)

Which lanes this event is relevant to, and why.

Lane	Relevance	Basis
LANE-OCEAN-TH-USEC	medium	lane includes country US; lane includes node NC
LANE-OCEAN-TH-USWC	low	lane includes country US

▼ Nine-area impact assessment

Impact by area. Event severity, impact severity, evidence strength and confidence are recorded separately.

Area	Status	Severity	Relevance	Evidence	Confidence
warehouse	insufficient evidence	none	none	C	low
logistics	insufficient evidence	none	none	C	low
transport	insufficient evidence	none	none	C	low

Area	Status	Severity	Relevance	Evidence	Confidence
import export	insufficient evidence	none	none	C	low

Elevated vessel waiting times reported at Singapore container terminals

EVT-20240520-001 · event date 2024-05-20 · published 2024-05-22 · retrieved 2024-06-10T00:00:00Z · last reviewed 2024-06-10T00:00:00Z · no confirmation that this event is still active

× External driver: not established

- **Operational change:** Vessel waiting times before berthing at Singapore container terminals rose above their normal range.
- **Logistics mechanism:** Longer waiting before berthing delays discharge and reloading of transshipment boxes, which extends connection times for cargo relayed through the hub.
- **Observable indicator:** Port authority operational notices reporting waiting time, and berth occupancy measures.
- **Outcome:** Observed capacity pressure at the hub, with potential service effects on Thailand cargo transshipped through it.

Chain completeness: complete

Thailand relevance basis:

- Singapore is the principal transshipment hub for Thailand long-haul ocean services, so waiting time at Singapore transmits to Thailand cargo through the transshipment leg.
- The transmission is through transshipment connection times, not through any direct Thailand port condition.

▼ Lane relevance (5)

Which lanes this event is relevant to, and why.

Lane	Relevance	Basis

event severity: low

Pasir Panjang oil spill response with port operations reported unaffected

EVT-20240614-002 · event date 2024-06-14 · published 2024-06-14 · retrieved 2024-06-20T00:00:00Z · last reviewed 2024-06-20T00:00:00Z · no confirmation that this event is still active

× External driver: not established

- **Operational change:** An oil spill response was mounted near Pasir Panjang Terminal.
- **Logistics mechanism:** A spill response can restrict navigation or berthing, which would delay vessel calls and transshipment connections.
- **Observable indicator:** Port authority notices stating whether navigation and berthing were restricted.
- **Outcome:** The operator stated that navigational traffic and berthing operations were not affected, so no material logistics impact was detected.

Chain completeness: complete

Thailand relevance basis:

- Singapore is Thailand's principal transshipment hub, so a port event there is assessed for a Thailand transshipment effect even when none is found.

Closure basis: The operating authority stated that navigation and berthing were unaffected, and no subsequent notice reported an operational restriction.

▼ Lane relevance (5)

Which lanes this event is relevant to, and why.

Lane	Relevance	Basis
LANE-OCEAN-TH-ASEAN-SG	medium	lane includes country SG; lane includes node NODE-SG; transits chokepoint CHK-SINGAPORE
LANE-OCEAN-TH-MED	medium	lane includes node NODE-SGSIN
LANE-OCEAN-TH-NEUR	medium	lane includes node NODE-SGSIN

energy shock

Thailand relevance: medium

event severity: moderate

Crude and refined product prices rise sharply, raising bunker and domestic fuel costs

EVT-20220301-001 · event date 2022-03-01 · published 2022-03-01 · retrieved 2022-06-30T00:00:00Z · last reviewed 2022-06-30T00:00:00Z · no confirmation that this event is still active

- **External driver:** A sharp rise in international crude and refined product prices.
- **Operational change:** Bunker fuel and domestic diesel prices rose alongside the international benchmark.
- **Logistics mechanism:** Bunker cost is a direct input to ocean freight pricing and is commonly recovered through bunker surcharges; domestic diesel is a direct input to inland drayage cost.
- **Observable indicator:** Published crude benchmarks and Thailand retail diesel prices.
- **Outcome:** Potential cost pressure across Thailand ocean lanes and the domestic port connection, with no measured effect on any Thailand shipment price.

Chain completeness: complete

Thailand relevance basis:

- Thailand imports refined product and prices domestic diesel against international benchmarks, so an international energy shock transmits into domestic transport cost.
- Bunker fuel is a direct input to ocean freight cost on every Thailand lane.

▼ Lane relevance (11)

Outlook

Human-approved AI assessments only.

No human-approved AI assessment exists. The human-triggered ChatGPT workflow, its input and output contracts, its rejection rules and its approval gate are implemented and tested, but producing an assessment requires a human to run a package through ChatGPT out-of-band. This section shows only human-approved assessments, so it is empty rather than speculative.

This repository calls no AI API. High or Critical conclusions can never be published without an explicit human-review record.

The review package a human hands to ChatGPT is built from the current view only. Synthetic observations, technical-demonstration indicators and lane assessments, historical-validation events and their evidence are filtered out and counted, and every approval is bound to the exact package it was produced from by that package's SHA-256. A demonstration package can be generated for exercising the workflow, but it records its own purpose and can never be approved into this section.

Assessment status

No AI assessment has been approved for publication. This is a coverage gap, not evidence that no assessment was produced.

Current deterministic lane outlooks

The outlooks below are a deterministic analytical product derived from the documented threshold rules, open events and data gaps. They are not an AI assessment and are shown separately from one. With zero qualified evidence the current outlooks state only what coverage is missing and what would have to happen before an assessment could begin.

Thailand ↔ Mainland China and Hong Kong

Base case

Horizon: 1-4 weeks · Confidence: low

No outlook can be offered for Thailand ↔ Mainland China and Hong Kong. The platform holds no qualified evidence for this lane, so its current state is unknown rather than unchanged. The trigger below is what would have to happen before any assessment could begin.

No numeric forecast is given anywhere in this platform, and with zero qualified evidence no qualitative direction is given either.

Trigger conditions: what would have to be observed, and where.

Condition	Observable via
a source covering this lane completes a controlled live validation and is enabled, or a human records a reviewed official notice for one of its nodes or chokepoints	the source registry's enablement records and the Sources and Methodology section

▼ Data gaps (1)

- No live-retrieved or human-reviewed evidence exists for this lane. Synthetic and historical-validation fixtures exercise the analysis engine but are excluded from the current view, so there is nothing to assess -- which is a coverage gap, not a finding that conditions are normal.

Deterioration case

Horizon: 1-4 weeks · Confidence: low

No outlook can be offered for Thailand ↔ Mainland China and Hong Kong. The platform holds no qualified evidence for this lane, so its current state is unknown rather than unchanged. The trigger below is what would have to happen before any assessment could begin.

No numeric forecast is given anywhere in this platform, and with zero qualified evidence no qualitative direction is given either.

Trigger conditions: what would have to be observed, and where.

Condition	Observable via
a source covering this lane completes a controlled live validation and is enabled, or a human records a reviewed official notice for one of its nodes or chokepoints	the source registry's enablement records and the Sources and Methodology section

▼ Data gaps (1)

- No live-retrieved or human-reviewed evidence exists for this lane. Synthetic and historical-validation fixtures exercise the analysis engine but are excluded from the current view, so there is nothing to assess -- which is a coverage gap, not a finding that conditions are normal.

Improvement case

Horizon: 1-4 weeks · Confidence: low

No outlook can be offered for Thailand ↔ Mainland China and Hong Kong. The platform holds no qualified evidence for this lane, so its current state is unknown rather than unchanged. The trigger below is what would have to happen before any assessment could begin.

No numeric forecast is given anywhere in this platform, and with zero qualified evidence no qualitative direction is given either.

Trigger conditions: what would have to be observed, and where.

Condition	Observable via

▼ Conditional preparedness options (2)

monitor

Organizations with cargo moving on Thailand ↔ Mainland China and Hong Kong may wish to track the domain readings and official notices recorded for this lane, so that a change is noticed when it occurs rather than afterwards.

Applies to: Organizations with exposure to Thailand ↔ Mainland China and Hong Kong

Trigger: The lane is published with an attention level of watch or elevated, or any domain crosses its documented threshold.

Exit: The lane returns to a routine attention level and no official notice is open against its nodes or chokepoints.

▼ Trade-offs and limitations

- Requires ongoing attention to a lane that may not change.
- This platform holds no shipment, booking or capacity data, so it cannot state whether any particular organization is exposed to this lane.

no action

No source-backed action is indicated for Thailand ↔ Mainland China and Hong Kong, because the platform currently has no usable reading for it. Absence of a reading is a coverage gap and is not a basis for either action or reassurance.

Applies to: Any reader of this lane

Trigger: Every domain for this lane reports insufficient evidence.

Exit: At least one domain acquires a usable reading.

▼ Trade-offs and limitations

- A real change could be occurring unobserved.
- This option exists because coverage is insufficient, not because the lane was assessed and found quiet.

Thailand ↔ Japan and Korea

Thailand ↔ United States East and Gulf Coast

Base case

Horizon: 1-4 weeks · Confidence: low

No outlook can be offered for Thailand ↔ United States East and Gulf Coast. The platform holds no qualified evidence for this lane, so its current state is unknown rather than unchanged. The trigger below is what would have to happen before any assessment could begin.

No numeric forecast is given anywhere in this platform, and with zero qualified evidence no qualitative direction is given either.

Trigger conditions: what would have to be observed, and where.

Condition	Observable via
a source covering this lane completes a controlled live validation and is enabled, or a human records a reviewed official notice for one of its nodes or chokepoints	the source registry's enablement records and the Sources and Methodology section

▼ Data gaps (1)

- No live-retrieved or human-reviewed evidence exists for this lane. Synthetic and historical-validation fixtures exercise the analysis engine but are excluded from the current view, so there is nothing to assess -- which is a coverage gap, not a finding that conditions are normal.

▼ Conditional preparedness options (3)

monitor

Organizations with cargo moving on Thailand ↔ United States East and Gulf Coast may wish to track the domain readings and official notices recorded for this lane, so that a change is noticed when it occurs rather than afterwards.

Applies to: Organizations with exposure to Thailand ↔ United States East and Gulf Coast

Trigger: The lane is published with an attention level of watch or elevated, or any domain crosses its documented threshold.

Exit: The lane returns to a routine attention level and no official notice is open against its nodes or chokepoints.

▼ Trade-offs and limitations

- Requires ongoing attention to a lane that may not change.
- This platform holds no shipment, booking or capacity data, so it cannot state whether any particular organization is exposed to this lane.

contingency

Where a lane transits a chokepoint with a registered notice channel, an organization may wish to understand in advance what an alternative routing would mean for its own transit-time assumptions.

Applies to: Organizations whose planning assumptions depend on Thailand ↔ United States East and Gulf Coast transit times

Trigger: An operating authority publishes a restriction affecting a chokepoint this lane transits.

Exit: The restriction is withdrawn or the lane's exposure is retired.

▼ Trade-offs and limitations

- Alternative routings usually carry their own cost or transit penalty.
- The platform does not model routings and publishes no transit-time estimate for any alternative.

no action

No source-backed action is indicated for Thailand ↔ United States East and Gulf Coast, because the platform currently has no usable reading for it. Absence of a reading is a coverage gap and is not a basis for either action or reassurance.

Applies to: Any reader of this lane

Trigger: Every domain for this lane reports insufficient evidence.

Exit: At least one domain acquires a usable reading.

▼ Trade-offs and limitations

- A real change could be occurring unobserved.
- This option exists because coverage is insufficient, not because the lane was assessed and found quiet.

Thailand ↔ Australia and New Zealand

Base case

Horizon: 1-4 weeks · Confidence: low

No outlook can be offered for Thailand ↔ Australia and New Zealand. The platform holds no qualified evidence for this lane, so its current state is unknown rather than unchanged. The trigger below is what would have to happen before any assessment could begin.

No numeric forecast is given anywhere in this platform, and with zero qualified evidence no qualitative direction is given either.

Thailand ↔ Mainland China and Hong Kong

Base case

Horizon: 1-4 weeks · Confidence: medium

Thailand ↔ Mainland China and Hong Kong currently reads as deteriorating across the nine assessed domains, with the freight benchmark and transit-time and service evidence deteriorating No operational event is currently open against this lane. 2 of nine domains have insufficient evidence, so the reading is partial.

No numeric forecast is given for freight, transit time, inventory or cost. No qualified dataset in this registry would support one.

Trigger conditions: what would have to be observed, and where.

Condition	Observable via
any source backing this lane changes freshness state, or a new official notice is recorded against a node or chokepoint the lane includes	the source-health snapshot and the official notice channels

▼ Data gaps (1)

- Overall source coverage is insufficient: no source in the registry is enabled, so every reading below is derived from labelled synthetic fixtures and describes the platform's behaviour, not the real world.

Deterioration case

Horizon: 1-4 weeks · Confidence: medium

A deterioration case for Thailand ↔ Mainland China and Hong Kong would show the domains below crossing their documented thresholds in the adverse direction, or an operating authority extending a restriction that affects this lane. The triggers state what would have to be observed; no magnitude or date is asserted here.

Trigger conditions: what would have to be observed, and where.

Condition	Observable via
thailand_trade_value year over year change falls to or below -7.5 percent (rule TH-TRADE-YOY-V1)	the thailand_trade_value observation series in this platform
port_throughput_volume year over year change falls to or below -7.5 percent (rule PORT-VOLUME-YOY-V1)	the port_throughput_volume observation series in this platform

usd_thb_rate month over month change falls to or below -2.0 percent (rule FX-MOM-V1)	the usd_thb_rate observation series in this platform

▼ Data gaps (1)

- Overall source coverage is insufficient: no source in the registry is enabled, so every reading below is derived from labelled synthetic fixtures and describes the platform's behaviour, not the real world.

▼ Conditional preparedness options (3)

monitor

Organizations with cargo moving on Thailand ↔ South Asia may wish to track the domain readings and official notices recorded for this lane, so that a change is noticed when it occurs rather than afterwards.

Applies to: Organizations with exposure to Thailand ↔ South Asia

Trigger: The lane is published with an attention level of watch or elevated, or any domain crosses its documented threshold.

Exit: The lane returns to a routine attention level and no official notice is open against its nodes or chokepoints.

▼ Trade-offs and limitations

- Requires ongoing attention to a lane that may not change.
- This platform holds no shipment, booking or capacity data, so it cannot state whether any particular organization is exposed to this lane.

verify exposure

An organization may wish to establish, from its own records, whether its cargo actually routes through the nodes and chokepoints that Thailand ↔ South Asia includes, since public data cannot establish that.

Applies to: Organizations that may have exposure to Thailand ↔ South Asia

Trigger: The lane is published at watch or elevated attention while the platform records no confirmation of which services actually transit its chokepoints.

Exit: Exposure has been established from the organization's own records.

▼ Trade-offs and limitations

- Requires internal information this public platform does not hold.
- Routing information is carrier-specific and is not published by any source qualified in this registry.

contingency

Where a lane transits a chokepoint with a registered notice channel, an organization may wish to understand in advance what an alternative routing would mean for its own transit-time assumptions.

Applies to: Organizations whose planning assumptions depend on Thailand ↔ South Asia transit times

Trigger: An operating authority publishes a restriction affecting a chokepoint this lane transits.

Exit: The restriction is withdrawn or the lane's exposure is retired.

▼ Trade-offs and limitations

- Alternative routings usually carry their own cost or transit penalty.
- The platform does not model routings and publishes no transit-time estimate for any alternative.

▼ Trade-offs and limitations

- Requires ongoing attention to a lane that may not change.
- This platform holds no shipment, booking or capacity data, so it cannot state whether any particular organization is exposed to this lane.

verify exposure

An organization may wish to establish, from its own records, whether its cargo actually routes through the nodes and chokepoints that Thailand ↔ United States East and Gulf Coast includes, since public data cannot establish that.

Applies to: Organizations that may have exposure to Thailand ↔ United States East and Gulf Coast

Trigger: The lane is published at watch or elevated attention while the platform records no confirmation of which services actually transit its chokepoints.

Exit: Exposure has been established from the organization's own records.

▼ Trade-offs and limitations

- Requires internal information this public platform does not hold.
- Routing information is carrier-specific and is not published by any source qualified in this registry.

contingency

Where a lane transits a chokepoint with a registered notice channel, an organization may wish to understand in advance what an alternative routing would mean for its own transit-time assumptions.

Applies to: Organizations whose planning assumptions depend on Thailand ↔ United States East and Gulf Coast transit times

Trigger: An operating authority publishes a restriction affecting a chokepoint this lane transits.

Exit: The restriction is withdrawn or the lane's exposure is retired.

▼ Trade-offs and limitations

- Alternative routings usually carry their own cost or transit penalty.
- The platform does not model routings and publishes no transit-time estimate for any alternative.

watch

Technical demonstration — synthetic fixture

Thailand ↔ Australia and New Zealand

Base case

Horizon: 1-4 weeks · Confidence: medium

Thailand ↔ Australia and New Zealand currently reads as deteriorating across the nine assessed domains, with the freight benchmark and transit-time and service evidence deteriorating No operational event is currently open against this lane. 2 of nine domains have insufficient evidence, so the reading is partial.

No numeric forecast is given for freight, transit time, inventory or cost. No qualified dataset in this registry would support one.

Trigger conditions: what would have to be observed, and where.

Condition	Observable via
any source backing this lane changes freshness state, or a new official notice is recorded against a node or chokepoint the lane includes	the source-health snapshot and the official notice channels

▼ Data gaps (1)

- Overall source coverage is insufficient: no source in the registry is enabled, so every reading below is derived from labelled synthetic fixtures and describes the platform's behaviour, not the real world.

Deterioration case

Horizon: 1-4 weeks · Confidence: medium

A deterioration case for Thailand ↔ Australia and New Zealand would show the domains below crossing their documented thresholds in the adverse direction, or an operating authority extending a restriction that affects this lane. The triggers state what would have to be observed; no magnitude or date is asserted here.

Trigger conditions: what would have to be observed, and where.

Condition	Observable via
thailand_trade_value year over year change falls to or below -7.5 percent (rule TH-TRADE-YOY-V1)	the thailand_trade_value observation series in this platform
port_throughput_volume year over year change falls to or below -7.5 percent (rule PORT-VOLUME-YOY-V1)	the port_throughput_volume observation series in this platform
container_freight_benchmark month over month change rises to or above +5.0 percent (rule FREIGHT-BENCHMARK-MOM-V1)	the container_freight_benchmark observation series in this platform
retail_or_bunker_fuel_price month over month change rises to or above +3.0 percent (rule FUEL-MOM-V1)	the retail_or_bunker_fuel_price observation series in this platform
usd_thb_rate month over month change rises to or above +2.0 percent (rule FX-MOM-V1)	the usd_thb_rate observation series in this platform

▼ Data gaps (1)

- Overall source coverage is insufficient: no source in the registry is enabled, so every reading below is derived from labelled synthetic fixtures and describes the platform's behaviour, not the real world.

Improvement case

Horizon: 1-3 months · Confidence: medium

An improvement case for Thailand ↔ Australia and New Zealand would show the same domains crossing their thresholds in the favourable direction, or an operating authority withdrawing a restriction. As with the deterioration case, the triggers are the monitorable part.

Trigger conditions: what would have to be observed, and where.

Condition	Observable via
thailand_trade_value year over year change rises to or above +7.5 percent (rule TH-TRADE-YOY-V1)	the thailand_trade_value observation series in this platform
port_throughput_volume year over year change rises to or above +7.5 percent (rule PORT-VOLUME-YOY-V1)	the port_throughput_volume observation series in this platform
container_freight_benchmark month over month change falls to or below -5.0 percent (rule FREIGHT-BENCHMARK-MOM-V1)	the container_freight_benchmark observation series in this platform
retail_or_bunker_fuel_price month over month change falls to or below -3.0 percent (rule FUEL-MOM-V1)	the retail_or_bunker_fuel_price observation series in this platform
usd_thb_rate month over month change falls to or below -2.0 percent (rule FX-MOM-V1)	the usd_thb_rate observation series in this platform

▼ Data gaps (1)

- Overall source coverage is insufficient: no source in the registry is enabled, so every reading below is derived from labelled synthetic fixtures and describes the platform's behaviour, not the real world.

▼ Conditional preparedness options (2)

monitor

Organizations with cargo moving on Thailand ↔ Australia and New Zealand may wish to track the domain readings and official notices recorded for this lane, so that a change is noticed when it occurs rather than afterwards.

Applies to: Organizations with exposure to Thailand ↔ Australia and New Zealand

Trigger: The lane is published with an attention level of watch or elevated, or any domain crosses its documented threshold.

Exit: The lane returns to a routine attention level and no official notice is open against its nodes or chokepoints.

▼ Trade-offs and limitations

- Requires ongoing attention to a lane that may not change.
- This platform holds no shipment, booking or capacity data, so it cannot state whether any particular organization is exposed to this lane.

▼ Enablement blockers (0)						
No blocker recorded.						
▼ Known limitations (7)						
- Hazard alerts do not by themselves establish operational logistics disruption. - Publication timing and alert levels vary by hazard type.						

Source	Owner	Class	Licence	Enabled	Health	Block
• No official fixed polling cadence or public rate-limit quota was found, expected_cadence_minutes is unknown, not a proven six-minute cadence. • Because expected_cadence_minutes is unknown, source-health evaluation currently derives its fresh/stale boundary from half of max_stale_minutes; this derived boundary is an implementation default, not an official GDACS cadence, and any future production-enablement change must define this explicitly rather than treating the derived value as fact. • Responses are limited to 100 records per page; callers must page with pagenumber (and optionally pagesize) to retrieve a full result set. • GDACS alert levels and impact estimates are model outputs and must remain a source signal (source_alert_level), never platform logistics severity. • Automatic notifications may contain uncertainty or error, do not replace national authorities, and have no guaranteed completeness or timeliness.						
Thai Meteorological Department warnings and CAP services TMD_CAP	Thai Meteorological Department	official	pending review	no	disabled	normal records

▼ Enablement blockers (0)						
No blocker recorded.						
▼ Known limitations (10)						
- Machine-readable endpoint and update cadence must pass an integration test before enablement. - A warning indicates hazard potential, not confirmed transport or facility disruption.						

Source	Owner	Class	Licence	Enabled	Health	Blo
- TMD's copyright notice permits non-commercial public republication with source attribution, but its separate website policy states that deep-linking to internal pages requires written permission; these statements are not fully aligned, so licence_status remains pending_review and the conflict is not assumed resolved. - The controlled manual workflow has validated content type and parseability of the live English and Thai endpoints (see the WO-003 evidence below): both currently serve a well-formed RSS envelope, not a direct CAP 1.2 alert. machine_readable_status therefore remains unverified specifically for direct CAP 1.2 compatibility at these URLs -- not because validation is pending, but because the validated result does not establish it -- and stays unverified until either the served content changes or a separate reviewed decision treats the RSS envelope itself as the machine-readable contract. - WO-003 controlled live-test evidence (2026-07-23, both the English and Thai URLs): HTTP 200, Content-Type text/xml, no redirect, no ETag or Last-Modified, XML root local name rss -- the strict CAP 1.2 parser correctly rejected both with 'expected {urn:oasis:names:tc:emergency:cap:1.2}alert, received rss' and zero staging records were emitted. - This conflicts with two official descriptions that remain unresolved by inference: the WMO Register of Alerting Authorities still lists both TMD URLs as CAP Feed URLs (https://alertingauthority.wmo.int/authorities.php?recId=164), and TMD's own RSS service page presents "CAP Warning" under "RSS format open data" (https://www.tmd.go.th/en/service/rss). - One observation date does not establish cadence or permanence; endpoint behavior may change, and this contract does not assume the RSS envelope is a permanent replacement for a direct CAP 1.2 alert at these URLs. - A controlled, discovery-only RSS-envelope path exists (collectors/adapters/rss_discovery.py, manual workflow tmd_operation=rss_discovery) to classify and inspect the envelope without weakening the strict CAP parser; it retains only bounded structural metadata, never fetches a discovered item link or enclosure, and never produces a staging record. - WO-005 (2026-07-23) used the RSS discovery path above, run under human-triggered gates, to observe candidate CAP filenames referenced by both the English and Thai RSS feeds; run IDs, artifact IDs, and response hashes are recorded in docs/tmd_candidate_cap_validation.md. This is discovery-only evidence -- candidate reachability, CAP-1.2-ness, cross-language semantic equivalence, and publication suitability were not established by WO-005. - WO-006 (Implementation v0.2.2) added a controlled, manually triggered, single-candidate CAP validation path (collectors/adapters/tmd_candidate.py, TmdCapAdapter.validate_candidate, manual workflow tmd_operation=candidate_cap_validation) that accepts only a bounded candidate reference -- never an arbitrary URL -- derives the fetch target from fixed host/port/path-prefix/filename-grammar policy, resolves and pins DNS with fail-closed non-global-address rejection, makes exactly one physical HTTPS GET, and runs the unchanged strict CAP 1.2 parser. See docs/tmd_candidate_cap_validation.md for the full security boundary, retained/excluded fields, and evidence. WO-006 is implementation only: no live candidate fetch was performed under it, and a separate WO-007 plus human approval is required before any live candidate fetch, source enablement, or publication.

Data period		not established				
Logistics role		global supply chain baseline				
Prototype eligibility		eligible pending validation				
Live validation		not performed				
Enabled		no				
Required for publication		no				
Health status		disabled				
▼ Enablement blockers (2)						
- No controlled live validation has been performed; the endpoint field is still null and no published download URL has been confirmed by observation. - Reuse and redistribution terms have not been reviewed against the publisher's stated conditions, so reuse_status and redistribution_status remain unknown.						
▼ Known limitations (4)						
Monthly baseline indicator; not suitable for real-time event detection.						

Source	Owner	Class	Licence	Enabled	Health	Bl
- Download endpoint must be verified before enablement. - WO-010: no controlled live validation could be performed, so the published file location, format and cadence remain unverified. The fixture-first adapter (collectors/adapters/csv_series.py, parser gscpi_v1) parses the documented CSV shape only. - The index is a global measure. It cannot establish a Thailand-specific or lane-specific conclusion on its own.						
Thai Customs import and export statistics TH_CUSTOMS	Thai Customs Department	official	pending review	no	disabled	3 rec

Source	Owner	Class	Licence	Enabled	Health	Blo

Publication cadence	monthly with variable lag					
Observed freshness	never observed					
Data period	not established					
Logistics role	thailand trade flow					
Prototype eligibility	eligible pending validation					
Live validation	not performed					
Enabled	no					
Required for publication	no					
Health status	disabled					

▼ Enablement blockers (3)

- No controlled live validation has been performed; no stable machine-readable download URL has been confirmed by observation, and the endpoint field remains null.
- Reuse and redistribution terms have not been reviewed, so reuse_status and redistribution_status remain unknown.
- The statistics portal is an interactive report builder; whether it exposes a stable CSV export without session state is unresolved.

Source	Owner	Class	Licence	Enabled	Health	Bl
▼ Known limitations (4)						
- The website can revise published statistics. - Export workflow and stable download URL require integration testing. - WO-010: no controlled live validation could be performed. The trade series used by the Ocean MVP are therefore synthetic test fixtures, labelled synthetic_test_fixture in every record, and no published Thailand trade value is claimed. - Published customs statistics are all-mode totals unless a mode dimension is explicitly provided; attributing them to ocean freight without that dimension would be an invented precision.						
EPPO retail fuel price publications EPPO_FUEL	Energy Policy and Planning Office, Thailand	official	pending review	no	disabled	3 rec

Logistics role	domestic fuel or energy cost					
Prototype eligibility	eligible pending validation					
Live validation	not performed					
Enabled	no					
Required for publication	no					
Health status	disabled					
▼ Enablement blockers (3)						
- Rate limits are unresolved and the access method makes repeated requests, so no collection schedule is justified. A manual-only disposition applies until the publisher's rate limits are established. - No controlled live validation has been performed; the endpoint field is null and the page is client-rendered, so a machine-readable extraction path is unconfirmed. - Reuse and redistribution terms have not been reviewed, so reuse_status and redistribution_status remain unknown.						

Source	Owner	Class	Licence	Enabled	Health	Blo
▼ Known limitations (4)						
- Dynamic page rendering may expose placeholders before the final data loads. - Parsed values require date, unit, and effective-date validation before publication. - WO-010: no controlled live validation could be performed. Fuel series used by the Ocean MVP are synthetic test fixtures, labelled synthetic_test_fixture in every record. - Retail pump prices are a domestic cost-context indicator. They are not bunker fuel prices and must not be presented as a shipping fuel cost.						
Bank of Thailand foreign exchange rates BOT_FX	Bank of Thailand	official	pending review	no	disabled	4 rec

Source	Owner	Class	Licence	Enabled	Health	Blockers

Logistics role		fx context				
Prototype eligibility		eligible pending validation				
Live validation		not performed				
Enabled		no				
Required for publication		no				
Health status		disabled				
▼ Enablement blockers (4)						
• Rate limits are unresolved and the access method makes repeated requests, so no collection schedule is justified. A manual-only disposition applies until the publisher's rate limits are established. • Requires an API key. No credential-handling mechanism exists in this repository and WO-010 does not introduce one. • No controlled live validation has been performed. • Reuse and redistribution terms have not been reviewed.						

Source	Owner	Class	Licence	Enabled	Health	Bl
▼ Known limitations (3)						
- The developer portal requires account registration and an API key. A key is a credential and must never be committed to this repository, so enablement additionally requires a secrets-handling decision that WO-010 does not make. - A reference exchange rate is a cost-context indicator. A change in it does not by itself establish a change in any freight, bunker or landed cost actually paid. - WO-010: no controlled live validation could be performed; the endpoint field is null and the response envelope is unverified.						
World Bank Commodity Price Data WB_COMMODITY	World Bank	international	pending review	no	disabled	3 rec

Source	Owner	Class	Licence	Enabled	Health	Blocked
Full registry record for World Bank Commodity Price Data.

Access cost	free					
Reuse status	unknown					
Redistribution	unknown					
Publication cadence	monthly					
Observed freshness	never observed					
Data period	not established					
Logistics role	domestic fuel or energy cost, global supply chain baseline					
Prototype eligibility	eligible pending validation					
Live validation	not performed					
Enabled	no					
Required for publication	no					
Health status	disabled					
▼ Enablement blockers (3)						
- No XLSX parser exists in this repository; adding one is outside the WO-010 scope and no fixture test has been written for this source. - No controlled live validation has been performed. - Reuse and redistribution terms have not been reviewed against the publisher's stated conditions.						
▼ Known limitations (3)						

Source	Owner	Class	Licence	Enabled	Health	Bl
- Global commodity benchmarks are energy-cost context. They are not a Thailand fuel price and not a bunker price paid by any carrier. - The published workbook format is XLSX; no XLSX parser is implemented by WO-010, so the fixture-first adapter covers the CSV shape only. - WO-010: no controlled live validation could be performed; the endpoint field is null.						
IMF PortWatch port activity and trade estimates IMF_PORTWATCH	International Monetary Fund	international	pending review	no	disabled	4 rec

Source	Owner	Class	Licence	Enabled	Health	Blockers
Full registry record for IMF PortWatch port activity and trade estimates.						
Field		Value				
Owner		International Monetary Fund				
Class		international

Endpoint		none recorded				
Access method		arcgis · json				
Machine readable		unverified				
Licence status		pending review				
Terms		not recorded				
Access cost		free				
Reuse status		unknown				
Redistribution		unknown				
Publication cadence		daily				
Observed freshness		never observed				
Data period		not established				
Logistics role		thailand port or maritime activity				
Prototype eligibility		eligible pending validation				
Live validation		not performed				
Enabled		no				
Required for publication		no				
Health status		disabled				
▼ Enablement blockers (4)						
- Rate limits are unresolved and the access method makes repeated requests, so no collection schedule is justified. A manual-only disposition applies until the publisher's rate limits are established. - No controlled live validation has been performed; no ArcGIS feature-service query URL has been confirmed by observation and the endpoint field remains null. - Reuse and redistribution terms have not been reviewed. - Whether derived daily estimates may be republished, as opposed to linked, is unresolved.						

Source	Owner	Class	Licence	Enabled	Health	Bl
▼ Known limitations (3)						
- PortWatch figures are model-derived estimates from vessel tracking, not port-authority reported throughput. They must be labelled as estimates and must never be presented as official port statistics. - Port call counts measure how many vessels called. They are a volume metric and can never on their own establish congestion, waiting time or berth delay. - WO-010: no controlled live validation could be performed; the ArcGIS query endpoint, its envelope shape and its rate limits are all unverified.						
UNCTAD maritime transport and connectivity indicators UNCTAD_MARITIME	United Nations Conference on Trade and Development	international	pending review	no	disabled	2 rec

▼ Enablement blockers (2)						
- No controlled live validation has been performed; no stable machine-readable download URL has been confirmed by observation. - Reuse and redistribution terms have not been reviewed.						
▼ Known limitations (2)						
Connectivity indices are structural measures published quarterly or annually. They describe how well connected an economy's liner network is: they are not an operational condition and cannot						

Source	Owner	Class	Licence	Enabled	Health	Blocked
detect an event. WO-010: no controlled live validation could be performed; the endpoint field is null.						
Port Authority of Thailand public notices PAT_NOTICE	Port Authority of Thailand	official	pending review	no	disabled	4 records

Source	Owner	Class	Licence	Enabled	Health	Bl
• An official notice is evidence of the notice itself. It is not automatically evidence of an operational impact on any particular lane, service or organization. • No machine-readable notice feed has been confirmed. Whether the site publishes an RSS or Atom feed is unverified. • Publication cadence is unknown, so no automated collection schedule is justified and none is configured. • WO-010: no controlled live validation could be performed.						
Panama Canal Authority advisories to shipping ACP_ADVISORY	Autoridad del Canal de Panamá	official	pending review	no	disabled	4 rec

Source	Owner	Class	Licence	Enabled	Health	Bl
• A canal advisory establishes the restriction it states. It does not establish which Thailand services actually route through the canal, and it therefore cannot on its own establish a Thailand lane impact. • Advisories are frequently published as PDF attachments; no PDF parser exists in this repository and none is added by WO-010. • WO-010: no controlled live validation could be performed.						
Suez Canal Authority circulars SCA_CIRCULAR	Suez Canal Authority	official	pending review	no	disabled	4 rec

Source	Owner	Class	Licence	Enabled	Health	Bl
• A circular establishes the rule or toll it states. Whether a given Thailand service transits the canal, and whether it was affected, requires separate evidence. • Circulars are frequently published as PDF attachments; no PDF parser exists in this repository. • WO-010: no controlled live validation could be performed.						
Maritime and Port Authority of Singapore port marine notices MPA_SG_NOTICE	Maritime and Port Authority of Singapore	regulator	pending review	no	disabled	3 rec

- No machine-readable notice feed has been confirmed; the endpoint field is null. - Reuse and redistribution terms have not been reviewed. - No controlled live validation has been performed.						
▼ Known limitations (3)						

Source	Owner	Class	Licence	Enabled	Health	Bl
• Singapore is a transshipment hub for Thailand cargo, so a notice here is relevant to Thailand only through the transshipment mechanism, which must be stated rather than assumed. • A port marine notice is evidence of the notice, not of an operational effect on any particular service. • WO-010: no controlled live validation could be performed.						
Maritime and Port Authority of Singapore vessel and container throughput statistics (data.gov.sg) MPA_SG_STATISTICS	Maritime and Port Authority of Singapore, published via data.gov.sg	regulator	reviewed	no	disabled	4 rec

Source	Owner	Class	Licence	Enabled	Health	Block
Full registry record for Maritime and Port Authority of Singapore vessel and container throughput statistics (data.gov.sg).						
Field	Value					
Owner	Maritime and Port Authority of Singapore, published via data.gov.sg					
Class	regulator					
Landing page	https://data.gov.sg/datasets/d_da030f7028200d19ffcbe4a2d71af39c/view

Access method	ckan · json					
Machine readable	verified					
Licence status	reviewed					
Terms	https://data.gov.sg/open-data-licence					
Access cost	free					
Reuse status	open licence					
Redistribution	permitted					
Publication cadence	monthly					
Observed freshness	WO-027 Part B (2026-07-31): latest available month at retrieval was 2026-05 -- 61 day after that month's period end (91 days after its period start). max_stale_minutes is evaluated against collection-run recency, not directly against this reporting lag; the two are related but not the same measurement. See docs/mpa_sg_statistics_qualification.r §9.					
Data period	2026-01 through 2026-05 observed in the 5 most recent records per resource (WO-027 Part B); result.total reports 377 records per resource, indicating substantial historical depth not yet read.					
Logistics role	external driver context					
Prototype eligibility	eligible pending validation					
Live validation	completed					
Enabled	no					
Required for publication	no					
Health status	disabled					

Source	Owner	Class	Licence	Enabled	Health	Blo
▼ Enablement blockers (4)						
- container_throughput's unit/scale is unverified against real evidence and must not be assumed; WO-027 Part C's scale-elimination reconciliation against official MPA annual totals corroborates a x1,000 ("thousand TEU") scale but is not an independently-read primary-source unit label, so it does not clear the bar to flip unit_verified. The parser's unit_verified flag defaults to False (fail-closed) and no production spec overrides it, so this series cannot currently be parsed at all. See docs/mpa_sg_statistics_qualification.md §8. - No external account or API key has been created; anonymous access is intended. WO-027 Part B's 2 sequential requests succeeded with no throttling, but that only partially exercises the documented rate limit, not its actual boundary. - gross_tonnage is a confirmed real field on the vessel-arrivals dataset, present in the WO-027 Part B live response, but has not been assessed as a capability; not wired into the parser. - The absence of personal data, third-party rights, patents, trademarks or design rights has been confirmed only for the fields WO-027 Part B actually requested and returned (a fields= projection); it has not been positively confirmed by reading either resource's complete schema from a live response, which docs/mpa_sg_statistics_qualification.md §1 item 3's human decision requires before publication. The broader basis for licence_status: reviewed still rests on the human's own primary-source dataset-page reading (§1 item 4), not on Part B.						
▼ Known limitations (11)						
- WO-026: this is Singapore hub activity, not a Thailand measurement. Singapore is a transshipment hub for Thailand cargo, so it is relevant to Thailand only through the transshipment mechanism, which must be stated rather than assumed -- the same caveat MPA_SG_NOTICE already carries. - Throughput and vessel-call counts are volume measures. They can never on their own establish congestion, waiting time or berth delay. - WO-027: the Datastore Search endpoint and the two datasets' field names are now human-confirmed against the primary data.gov.sg pages (container_throughput, number_of_vessels, gross_tonnage), correcting WO-026's wrong guesses (total_teus, total_vessels). See docs/mpa_sg_statistics_qualification.md §2. - WO-027: container_throughput's raw numeric scale does not obviously match individual TEUs against official MPA annual statements (41.12M TEU for 2024, 44.66M TEU for 2025). The unit/scale is unverified and must not be assumed or converted by a guessed factor -- collectors/adapters/data_gov_sg.py's DatastoreSeriesSpec.unit_verified defaults to False (fail-closed), so parsing this series requires a caller to affirmatively mark the unit trustworthy; no production spec exists yet that does so. See docs/mpa_sg_statistics_qualification.md §3. - gross_tonnage is a confirmed real field on the vessel-arrivals dataset but is not wired into any parsed capability; it must be assessed separately before being added, per the human decision recorded on Issue - Covers two Datastore Search resources under one contract -- container throughput and vessel arrivals -- distinguished by resource_id, the same one-contract/multiple-series pattern PAT_STATISTICS uses for its two terminals.						

Source	Owner	Class	Licence	Enabled	Health	Blo
- Registration requirement is recorded as none because data.gov.sg's own developer documentation states public Datastore Search reads need no API key; anonymous access is rate-limited (documented as 4 Datastore Search calls / 10s, 2 dataset-download calls / 10s) and this has not yet been independently observed. - WO-027 Part D: none of the fields actually requested/returned in the Part B live validation (month, container_throughput, number_of_vessels, gross_tonnage) is capable of carrying personal data, a third-party identifier, or free text. Both Part B requests used a fields= projection, so this response cannot enumerate either resource's full schema (evidenced by CKAN's own _id field, present in the fixtures, never appearing in the projected live records) -- the broader schema confirmation still rests on the human primary-source reading recorded in docs/mpa_sg_statistics_qualification.md §1 item 4, not on Part B's response. See §6, §9. - WO-027 Part B: the bounded 2-request controlled live validation human-authorized on Issue #56 was executed 2026-07-31 from an environment that allowlists data.gov.sg (a prior session's environment denied it; that was an environment-policy failure, not a data.gov.sg source response). Both requests succeeded (HTTP 200, application/json, matching the assumed CKAN envelope). See docs/mpa_sg_statistics_qualification.md §7 and docs/evidence/wo027_part_b_live_validation.json. - WO-027 Part C: reconciling the live-validated container_throughput values against official MPA annual totals (41.12M TEU 2024, 44.66M TEU 2025) by scale elimination finds only a x1,000 ("thousand TEU") scale physically plausible, but this is analytical inference corroborated by magnitude elimination, not an independently-read primary-source unit label -- unit_verified stays False by deliberate decision. See docs/mpa_sg_statistics_qualification.md §8. - Anonymous rate-limit behaviour is only partially exercised: the two Part B requests succeeded with no throttling response, well under the documented 4-calls/10s anonymous limit, but that is not an independent test of the limit boundary itself.						
Human-reviewed official operational notice intake MANUAL_NOTICE_INTAKE	Logistics Situation Platform maintainers	official	reviewed	no	disabled	1 rec

Source	Owner	Class	Licence	Enabled	Health	Blocked
Full registry record for Human-reviewed official operational notice intake.

Required for publication	no					
Health status	disabled					
▼ Enablement blockers (1)						
No notice has yet been recorded through this path, so the intake exists but currently contributes no coverage.						
▼ Known limitations (4)						
This is a bounded manual intake path, not an automated collector. It makes no network request of any kind.						

Source	Owner	Class	Licence	Enabled	Health	Block
• A human records a bounded reference to an official notice they have read at the publisher's own site, together with the publisher, the notice reference, the publication date and a claim of at most 600 characters. Full notice text is never copied into this repository. • Coverage is whatever a human happened to record. Absence of a notice here is never evidence that no notice was published. • Every record must still name the underlying publisher as the evidence source; this contract is the intake mechanism, not the authority.						
Free structured public news discovery NEWS_DISCOVERY	The GDELT Project	news	pending review	no	disabled	3 rec

▼ Enablement blockers (3)						
- Rate limits are unresolved and the access method makes repeated requests, so no collection schedule is justified. A manual-only disposition applies until the publisher's rate limits are established. - No controlled live validation has been performed; the query endpoint and its rate limits are unverified and the endpoint field is null. - Reuse terms have not been reviewed. Only link-level redistribution would be considered even if they were.						

Source	Owner	Class	Licence	Enabled	Health	Blots
▼ Known limitations (5)						
- This is a DISCOVERY source only. Every record it produces carries evidence_role 'discovery_only' and can never be the sole evidence for a material impact conclusion. - Only headline-level metadata and the publisher's own URL are retained. Article bodies are never fetched, stored or republished. - Coverage is skewed toward English-language and heavily syndicated outlets, so absence of a lead is not evidence that nothing happened. - Automated relevance matching produces false positives; every lead requires primary-source verification before it can support any conclusion. - WO-010: no controlled live validation could be performed; the endpoint field is null.

▼ Enablement blockers (4)						
- Rate limits are unresolved and the access method makes repeated requests, so no collection schedule is justified. A manual-only disposition applies until the publisher's rate limits are established. - No machine-readable statistics endpoint has been confirmed; the endpoint field is null. - No controlled live validation has been performed. - Reuse and redistribution terms have not been reviewed, so reuse_status and redistribution_status remain unknown.						

Source	Owner	Class	Licence	Enabled	Health	Bl
▼ Known limitations (4)						
- Reported throughput published by the port authority is a different measure from a model-derived vessel-tracking estimate. The two must never be presented as the same series, which is the WO-010-R1 correction: Thailand container throughput now stands in for this candidate rather than for IMF_PORTWATCH. - Throughput is a volume measure. It can never on its own establish congestion, waiting time or berth delay. - No machine-readable statistics endpoint has been confirmed; whether figures are published in a parseable form is unverified. - WO-010-R1: no controlled live validation could be performed.						
Freightos Baltic Index public container freight series FBX_PUBLIC	Freightos	industry	pending review	no	disabled	4 rec

- Rate limits are unresolved and the access method makes repeated requests, so no collection schedule is justified. A manual-only disposition applies until the publisher's rate limits are established.
- No controlled live validation has been performed; no machine-readable endpoint is confirmed and the endpoint field is null.
- Reuse and redistribution terms have not been reviewed. The index is a commercial product and its free display tier's reuse position is unresolved.

Source	Owner	Class	Licence	Enabled	Health	Block
Part of the product is behind a paywall (paywall_status is partial), which series are genuinely free is unverified.						
▼ Known limitations (6)						
- This is a market benchmark for named east-west container routes. It is NOT a Thailand shipment quotation, NOT a Thailand average, and NOT a rate paid by any shipper. It may be used only as a directional indicator. - No route in this index is a Thailand-origin route, so any Thailand reading derived from it is directional context only and must be labelled as such. - WO-010-R1 registered this candidate so that the synthetic freight benchmark has a correctly scoped source to stand in for. WO-010 had attributed it to EPPO_FUEL, a domestic retail fuel publisher, which was wrong in both route scope and cost family. - Whether the publicly displayed series is redistributable, as opposed to linkable, is unresolved. Only a directional derived reading would be considered even if reuse were permitted. - The index is a commercial product with a free public display tier. The free tier's coverage, history depth and machine-readability are all unverified. - WO-010-R1: no controlled live validation could be performed.
